(54) SUBSTRATE STRUCTURE FOR ORGANIC EL
ELEMENT AND ITS FORMING METHOD

(57) Abstract:

PROBLEM TO BE SOLVED: To provide uniform and bright luminescence without generating a short circuit between electrodes with a simple structure.

SOLUTION: Transparent electrodes 24 made of a transparent electrode material such as ITO are formed on the face of the first substrate made of a resin in a prescribed pattern by mask deposition or etching, an insulating layer 28 made of an insulating material such as SiO_2 is laminated on the surfaces of the transparent electrodes 24, and the second substrate 32 made of glass is provided on its surface. The first substrate is removed, and a luminescence layer 35 made of an organic EL material constituted of a hole transportation material 34, an electron transportation material 36 and other luminescence material is laminated on the flat plane removed with the first substrate.
